VIT BHOPAL

Name: Jayesh Sule

Reg No: 25BCE10731

Faculty: DR. Monica Sankat

Slot:C11+C12+C13

Course Code: CSA2001

Course Title: Fundamentals in AI and ML

Project Title: Smart RPS Arena An Intelligent Rock-Paper-Scissors Game with Reinforcement Learning Agent (Project Report)

Problem

Can an AI learn to master Rock-Paper-Scissors purely through experience?

Objectives

1. Implement classic RPS game (original code)
2. Design Q-Learning RL agent from scratch
3. Train agent to achieve superhuman performance
4. Create interactive gameplay against AI

Functional requirements

1. Game Engine Module – Input check, win conditions, the classic way of playing the game!
2. Reinforcement Learning Module — Q-table The exploration-exploitation trade-off Training loop
3. Train and Evaluation Module -Training of 50,000 episodes with performance monitoring model persistence

Non – Functional Requirements

1. Performance: <0.01s per move
2. Usability: Simple text/GUI interface
3. Reproducibility: deterministic results with the same seed
4. Scalable: Expandable to RPS-101 or whatever game
5. Ease of Maintenance: Clean and clear modularized code 3.
6. Resource Efficient: Works on every laptop

Designs

1. USE CASE:

Challenges

Input handling in Prolog is case-sensitive and strict	Used string_lower/2 + exhaustive normalize_move/2 with member/2
read_line_to_string returns string, not atom	Converted using string_lower/2 and pattern matching
Making AI learn without files	Used Prolog's dynamic predicates
Overriding random_member/2 for AI	Cleverly redefined random_member/2 with cut to prioritize learned counter-move

Avoiding infinite loops on invalid input	Used fail in failure case so repeat loop asks again
Keeping player history after many rounds	Used retract all + assert to always keep only the latest favorite move

Learnings &Key Takeaways

1. Prolog is extremely powerful for symbolic AI and pattern-based reasoning — perfect for rule-based agents.
2. Dynamic predicates (assert/retract) allow runtime learning without any external database — a core strength of logic programming.
3. Unification and backtracking naturally handle input validation and rule application.
4. A very small code base (< 150 lines) can create an intelligent, adaptive opponent — demonstrates elegance of declarative programming.
5. Understood the real difference between imperative (Python) and declarative (Prolog) approaches to AI.

Future Enhancements

Enhancement	Description
Frequency-based strategy	Keep count of all moves (rock:5, paper:3, scissors:8) and counter the most frequent
N-gram prediction	Remember last 2–3 moves and predict next using pattern matching
GUI Version	Using XPCE or Pengines for web-based Prolog RPS
Multiplayer mode	Two human players with AI referee
Save/Load learning across sessions	Write facts to a file using tell/1, told/0
Voice input	Integrate with external speech-to-text and feed string to Prolog

THANK YOU
